

DRAIN MEASUREMENT LOG FOR PATIENTS

- You will need to empty the drains at least every 6-8 hours, then keep track of the 24-hour total. The 24-hour total will determine if the drain can be removed.
- Use a clean measuring cup to measure the fluid quantity and record the output.
- Please enter the number of milliliters (cc's) out of each drain over the entire 24-hour period. This will help us decide when the drains can be removed.
- Typically, the drain should measure less than 30ml for 2 consecutive days before it is removed in the clinic.
- Please keep drain sites clean using peroxide or alcohol swab and then cover with gauze dressing. This will help prevent infection.
- Do not contaminate the inside of the drain.
- If there is clear-pink drainage around the drain site, reinforce with clean gauze.
- Call the clinic with any questions.
- The Plastic Surgery Clinic phone number is: 617-632-7827
